Excerpt from An Overview of Floor Slip-Resistance Research With Annotated Bibliography Slips and falls in the home as well as in public buildings have reached serious proportions accidents per year in the home, resulting in deaths and disabling injuries). This paper reviews the literature relating to this problem. Based on studies of kinesiology and

anthropometry, the coefficient of friction between foot surfaces and floor surfaces is found to be a significant parameter controlling slips and falls. A review of the general study of friction and a critical appraisal of methods for determining the coefficient of friction on slip - resistance of floors leads to a guide for selection of slip - resistance criteria. The paper concludes with a discussion of the legal aspects of the problem and the present status of slip - resistance specifications. Key words:

Changing economic conditions, concern for historic preservation, emphasis on fully utilizing conveniently located structures, space shortages, and increasing cost of materials and products used in the construction of new buildings, have resulted in a need to evaluate and more fully utilize the existing building inventory. To this end, this revision of the ASCE Standard Guideline for Structural Condition Assessment of Existing Buildings (a replacement of ASCE 11-90) provides the design community with guidelines for assessing the structural conditions of existing buildings constructed of

combinations of material including concrete, masonry, metals, and wood. It consists of an overview of preliminary and detailed assessment procedures, of materials properties and test methods, and of evaluation procedures for various physical conditions of the structure. This information has been compiled and subjected to a consensus review and approved by the ASCE Standards Committee on Structural Condition to provide a much needed resource standards on building condition assessment for selected materials, and for other areas related to the structural performance of buildings. Professional

engineers, building owners, and regulatory officials will find this Standard Guideline invaluable.

This book is dedicated to Aristid Lindenmayer on the occasion of his 60th birthday on November 17, 1985. Contributions range from mathematics and theoretical computer science to biology. Aristid Lindenmayer introduced language-theoretic models for developmental biology in 1968. Since then the models have been customarily referred to as L systems. Lindenmayer's invention turned out to be one of the most beautiful examples of interdisciplinary science:

work in one area (developmental biology) induces most fruitful ideas in other areas (theory of formal languages and automata, and formal power series). As evident from the articles and references in this book, the interest in L systems is continuously growing. For newcomers the first contact with L systems usually happens via the most basic class of L systems, namely, DOL systems. Here "0" stands for zero context between developing cells. It has been a major typographical problem that printers are unable to distinguish between 0 (zero) and 0 (oh). Thus, DOL was almost always printed with "oh" rather

File Type PDF Ansiasse A108 2011 Scaffolding Safety Requirements

than "zero", and also pronounced that way. However, this misunderstanding turned out to be very fortunate. The wrong spelling "DOL" of "DOL" could be read in the suggestive way: DO L Indeed, hundreds of researchers have followed this suggestion. Some of them appear as contributors to this book. Of the many who could not contribute, we in particular regret the absence of A. Ehrenfeucht, G. Herman and H.A. Maurer whose influence in the theory of L systems has been most significant. Slips and Falls: A new Approach to Friction Measurements is an explanation of the physics topic of friction and its relation to slips and falls. As well as slipping phenomena, other important and relevant friction related concepts and applications are presented to clearly guide you through this complex topic. This book explains the use of equipment such as tribometers in measuring friction in

falls and their level of accuracy. It explains other measuring techniques used and assumptions that come up when working with friction in fall cases, and shows which ones are erroneous and which are valid. It also discusses other aspects that apply to the physics of friction in slip and fall accidents. It gives you a back-to-basics understanding of the physics of falls. It is an essential book and a call to action for any professional currently involved in the investigation, research and litigation of slip and fall incidents. Prepared by the Design of Steel Transmission Towers Standards Committee of the Codes and Standards Activities Division of the Structural Engineering Institute of ASCE This standard provides requirements for the design, fabrication, and testing of members and connections for latticed steel electrical transmission structures. Covering guyed and self-supporting structures, these requirements

are applicable to hot-rolled and cold-formed steel shapes. The standard specifies the design criteria for structure components--members, connections, and guys--to resist design-factored loads at stresses approaching yielding, buckling, or fracture. This new edition, which replaces the previous Standard ASCE 10-97, presents minor changes to the design requirements and introduces new sections on redundant members, welded angles, anchor bolts with base plates on leveling nuts, and post angle member splices. Topics include: loading, geometry, and analysis; design of members, including compression members, tension members, and beams; design of connections, including fasteners, minimum distances, and attachment holes; detailing and fabrication; full-scale structure testing; structural members and connections used in foundations; and quality assurance and quality

control. A detailed commentary contains explanatory and supplementary information to assist users of the standard. In addition, one appendix offers 17 design examples, and a new appendix offers guidance for evaluating older (legacy) electrical transmission towers. Standard ASCE/SEI 10-15 is a primary reference for structural engineers designing latticed steel electrical transmission structures, as well as for other engineers, inspectors, and utility officials involved in the electric power transmission industry.

cannot put the same shoe on every foot.” (Maxim 596) Though written long before the advent of forensic science, Syrus’ maxim summarizes the theme of Forensic Medicine of the Lower Extremity: Human Identification and Trauma Analysis of the Thigh, Leg, and Foot. Put simply, the lower extremity is a tremendously variable anatomic region. This variation is beneficial to forensic experts. Differences in the leg and foot can be used to establish individual identity. Analysis of damage to the lower limb can be used to reconstruct antemortem, perimortem, and postmortem trauma. As a forensic

anthropologist, I analyze cases involving decomposed, burned, m- mified, mutilated, and skeletal remains. Many of the corpses I examine are incomplete. Occasionally, I receive nothing but the legs and feet; a lower torso dragged from a river; a foot recovered in a city park; dismembered drug dealers in plastic bags; victims of bombings and airline disasters; and the dead commingled in common graves. Though the leg and foot contain much that is useful in forensic analysis, before this publication, investigators faced a twofold problem. Little research that focused on the lower extremity

was available in the literature, and the existing research was published in diverse sources, making its location and synthesis a daunting task.

To predict our future, we must look to the extremes. So argues the economist Richard Davies, who takes readers to the margins of the modern economy and beyond. These extreme economies illustrate the forces that test human resilience, drive societies to failure, and promise to shape our collective future.

Reviving a foundational idea from the medical sciences, *Extreme Economies* turns the logic of modern economics on its head by arguing

that these outlier societies can teach us more about our own than we might imagine. By adapting to circumstances unimaginable to most of us, the people in these societies are pioneering the economic infrastructure of the future.

As the population ages, physicians will increasingly care for elderly and other persons residing in nursing homes and other life-care facilities. More than 1.5 million Americans live in nursing homes; their number may triple in the next generation. Good and caring physicians have been hesitant about delivering care in nursing homes or have been reluctant to visit them at all. The reasons range from inconvenience to lack of information about or comfort dealing with the common clinical problems encountered. Specialist geriatricians are not the answer to the growing need for care of frail older patients; generalist physicians are now expected and will continue to be expected to provide primary care to adults of all ages, including those residing in nursing homes.
